

Business Problem Statement

PT Maju Jaya Retail is a fictional retail company that manages sales transactions from both individual customers and resellers. The company relies heavily on manual data entry for its sales invoicing process, which frequently leads to data quality issues such as duplicate records, inconsistent formats, incorrect values, and calculation errors.

These data issues reduce the reliability of sales and invoice reports, making it difficult for management to accurately monitor sales performance, track payments, and support timely decision-making. To address this challenge, the company requires clean, consistent, and validated sales invoicing data that can be trusted for reporting and business analysis.

Key business question:

“How can systematic data cleaning and validation improve the reliability of invoice data to support accurate reporting and business decision-making?”

Deliverables

1. **Raw Invoicing Dataset**
Simulated sales invoice data with common manual entry errors.
2. **Data Cleaning & Standardization**
Cleaning and formatting performed using Google Sheets / Excel.
3. **Data Validation & Quality Control**
Validation rules and conditional formatting to prevent future errors.
4. **Clean Dataset**
A consistent, analysis-ready invoicing dataset.
5. **Project Documentation & GitHub Repository**
Complete documentation and an organized repository containing all project files.
